

Thank you for the purchase of your new Audi Headlight duct from Race3.ca

Here are some things to note during the installation:

Much like the factory headlight, you have three points of adjustment to help position the lense of the duct to your liking. Feel free to sand the edges down on the lense to better fit your car, the body lines of every car sit a bit different over the course of 18 years since the last production of the A4 B5 Audi. A few pieces of extra M3 hardware is supplied to aid you in re-assembly of the parts if you decided to paint the inside of the lense, and you have lost a few bolts and nuts along the way.

ABS, PETG, PLA and Lexan are all forms of plastic. Their melting point is 230C and up. Deformation of these parts could happen a bit lower than this temperature. The manufacturer of the part does not assume responsibility of warranty replacing damaged parts due to excessive heat. The manufacturer is not aware of the turbo setup you could be running and the heat environment this duct could be exposed to in standing traffic. This item was intended for off-road use.

There are many heat protection solutions available on the market from DCI, Techflex, and DEI. Each are available through major performance distribution warehouses in the USA and Canada. Feel free to call or text me, Jay Thornton at 416 894 2095 for further guidance if you feel the duct may need protection from temps beyond earlier mentioned.

Spare parts are available upon request. I can also work with you to design other items for the B5 chassis.
